

Peterson's 2-process algorithm (Peterson, 1981)

initially: $b[0] := \text{false}$, $b[1] := \text{false}$, initial value of turn immaterial

Program for process 0

- 1. $b[0] := \text{true}$
- 2. $\text{turn} := 0$
- 3. await ($b[1] = \text{false}$ or $\text{turn} = 1$)
- 4. CS
- 5. $b[0] := \text{false}$

Program for process 1

- 1. $b[1] := \text{true}$
- 2. $\text{turn} := 1$
- 3. await ($b[0] = \text{false}$ or $\text{turn} = 0$)
- 4. CS
- 5. $b[1] := \text{false}$
